Response

Meet Robert Smith — a hands-on electrical and electronics engineer with four decades of experience spanning defence systems, transport, industrial electronics, telecommunications, security systems, and applied engineering support.

Robert combines deep technical troubleshooting ability with practical field experience across electrical engineering, electronics, auto-electrics, testing, prototyping, manufacturing support, and systems integration. From military-grade equipment maintenance and DSP troubleshooting to rail vehicle specifications and production-line electrical systems, his career reflects a rare breadth of real-world engineering exposure.

A graduate of UNSW Electrical Engineering & Telecommunications with a BE in Electronics & Communications, Robert has contributed across multiple engineering disciplines including:

- Electrical and electronic design
- PCB testing and fault diagnostics
- Auto-electrical systems
- Defence and military electronics
- Rail and transport engineering
- Security and communications systems
- Industrial manufacturing support
- Technical documentation and process improvement
- Calibration, testing, and quality systems

His career includes roles with organizations such as UGL Limited, Volgren Australia Pty. Ltd., Tenix Defence Pty Ltd, and long-standing involvement with the UNSW EE&T Alumni community.

Known for solving problems down to first principles, Robert has worked from component-level diagnostics through to system-level engineering, while also mentoring apprentices, improving production procedures, and supporting multidisciplinary engineering teams. His background bridges classic analogue and digital electronics with modern industrial electrical systems — making him equally comfortable on the workshop floor, in the field, or collaborating with engineering and R&D teams.

Robert represents the kind of engineer the industry values highly: technically grounded, adaptable, practical, and experienced across the full lifecycle from design and testing to maintenance, commissioning, and continuous improvement.
