

FROM NATURE TO ELECTRONICS

https://eeexplorer.info/1_TbxChrtElBr

By observing **nature**, the laws of **physics** are created such as Light, Sound, Heat, Gravity, Magnetism, and Viscosity (flow). Much the same for chemistry, biology and mechanics.

The field of **electricity** is an application of physics where you can sense or control electrons for heat, light particles, sound waves or magnetic fields.

The field of **electronics** is a smaller and finer application of the larger electrical currents and fields.

Mathematics is a language used to describe the electrical system, the components and the flow of electricity around a circuit.
